

Subject: Fluid Mechanics and Hydraulic machine  
Chapter : Fluid and their Properties  
Topic : **Fluid and Their Properties**

# Introduction of Fluid

- Fluid mechanics is a study of the behavior of fluids, either at rest (**fluid statics**) or in motion (**fluid dynamics**).
- The analysis is based on the fundamental laws of mechanics, which relate continuity of mass and energy with force and momentum.
- An understanding of the properties and behavior of fluids at rest and in motion is of great importance in engineering.

Solid  $\times \rightarrow$  SOM  
liquid  $\rightarrow$  Fluid  
gas  $\rightarrow$  Fluid  
Flow

# Definition of Fluid

- Fluid can be defined as a substance which can deform continuously when being subjected to shear stress at any magnitude. In other words, it can flow continuously as a result of shearing action. This includes any liquid or gas.

# Density

Density of a fluid, ...,  $\rho$

Definition: mass per unit volume,

- slightly affected by changes in temperature and pressure.

$$\rho = \text{mass/volume} = m/V$$

Units:  $\text{kg/m}^3$  or  $\text{g/cm}^3$

Typical values:

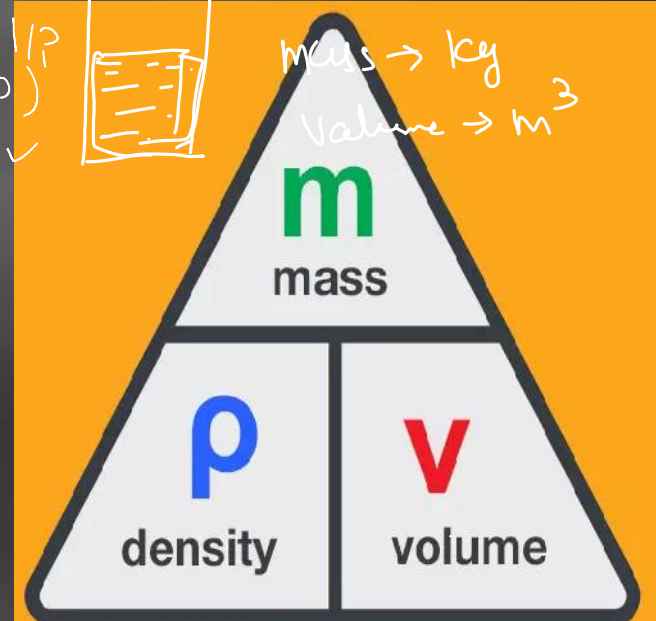

$$\checkmark \text{Water} = 1000 \text{ kg/m}^3;$$

$$= 1 \text{ kg/l}$$

$$1 \text{ m}^3 = 1000 \text{ litre}$$

$$\checkmark \text{Air} = 1.23 \text{ kg/m}^3$$

$\rho \propto f(T, P)$

**density** = mass  $\div$  volume  
**mass** = density  $\times$  volume  
**volume** = mass  $\div$  density

# Specific weight or Weight Density

Specific weight of a fluid,  $\gamma$

$$m \text{ kg} \quad g \text{ m/s}^2$$

$$\frac{\text{kg} \cdot \text{m}}{\text{s}^2}$$

- Definition: weight of the fluid per unit volume
- Arising from the existence of a gravitational force
- The relationship  $\gamma$  and  $g$  can be found using the following:

Since  
therefore  
Units:  $\text{N/m}^3$

$$\rho = m/V$$

$$\gamma = \rho g$$

$$= \rho g$$

$$\frac{N}{\text{m}^3} = \frac{mg}{V}$$

$$= \rho g$$

Typical values:

Water =  $9814 \text{ N/m}^3$ ;

Air =  $12.07 \text{ N/m}^3$

# Specific gravity or Relative Density

The specific gravity (or relative density) can be defined in two ways:

Definition 1:

A ratio of the density of a substance to the density of water at standard temperature (4°C) and atmospheric pressure, or

$$g_{aj} \quad \text{SP. gravity} = \frac{\rho_{gas}}{\rho_w} \frac{1 \text{ g/cm}^3}{1 \text{ g/cm}^3}$$

Definition 2:

A ratio of the specific weight of a substance to the specific weight of water at standard temperature (4°C) and atmospheric pressure.

$$\checkmark \text{ SP. gravity} = \frac{\gamma_F}{\gamma_w}$$

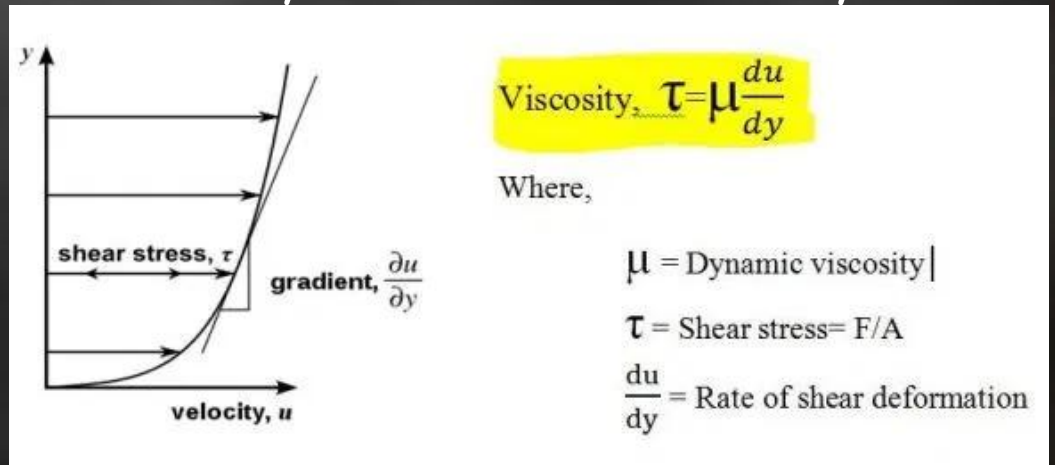

Unit: dimensionless.

$$SG = \frac{\dots_s}{\dots_w} = \frac{X_s}{X_w}$$

# Viscosity (Dynamic viscosity)

- Viscosity,  $\mu$ , is the property of a fluid, due to cohesion and interaction between molecules, which offers resistance to shear deformation.
- Different fluids deform at different rates under the same shear stress. The ease with which a fluid pours is an indication of its viscosity. Fluid with a high viscosity such as syrup deforms more slowly than fluid with a low viscosity such as water. The viscosity is also known as dynamic viscosity.

Units: N.s/m<sup>2</sup> or kg/m/s

Shear stress  $\tau \propto \frac{dy}{dy} \Rightarrow$  Velocity gradient

$$\tau = \frac{F}{A} = \frac{N}{m^2} = \mu \frac{dy}{dy} \frac{m/s}{m} = \frac{\text{Change in Velocity}}{\text{Distance from free surface (Two)}}$$

$$\mu = \tau / \frac{dy}{dy} = \frac{N}{m^2} \times \frac{m}{m/s} = \sqrt{\frac{N \cdot s}{m^2}}$$

# ✓ Newtonian and Non-Newtonian Fluid

Fluid obey --- ▶ Newton's law of viscosity refer --- ▶ Newtonian fluids

$$\tau = \mu \frac{du}{dy}$$

Newton's' law of viscosity is given by;

$$\tau = \mu \frac{du}{dy}$$

$\tau$  = shear stress

$\mu$  = viscosity of fluid

$du/dy$  = shear rate, rate of strain or velocity gradient

Example:

Air ✓  
Water ✓  
Oil ✓  
Gasoline ✓  
Alcohol ✓  
Kerosene ✓  
Benzene ✓  
Glycerin ✓

- The viscosity  $\mu$  is a function only of the condition of the fluid, particularly its temperature.

# Newtonian and Non-Newtonian Fluid

Fluid Do not obey -----> Newton's law of viscosity refer -----> Non-Newtonian fluids

- The viscosity of the non-Newtonian fluid is dependent on the velocity gradient as well as the condition of the fluid.

## Newtonian Fluids

- a linear relationship between shear stress and the velocity gradient (rate of shear),
- the slope is constant
- the viscosity is constant

$$\tau = \mu \frac{dy}{dx} + c$$

$$y = mx + c$$

## Non-Newtonian fluids

- slope of the curves for non-Newtonian fluids varies

# Types of Fluids

$$\tau = \mu \left( \frac{du}{dy} \right)^n + C$$

$$C \neq 0$$

$$n \neq 1$$

$$y = m x + C$$

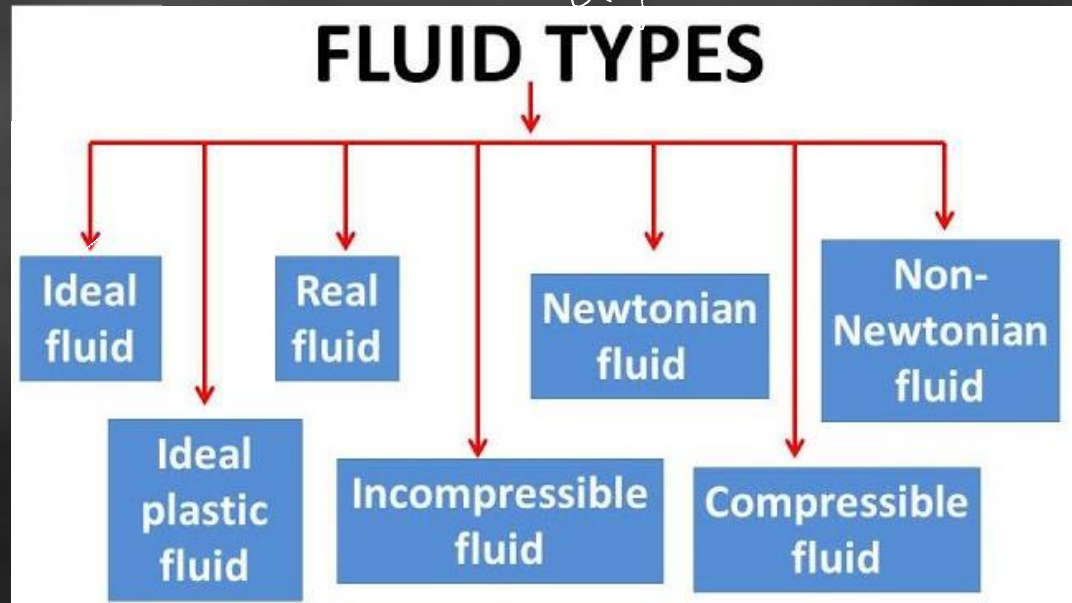

$$n = 1$$

$$y \rightarrow x$$

$$\Rightarrow \tau = \mu \frac{du}{dy}$$

Types of fluid based on two value

1. Value of  $n$  ✓
2. Value of  $C$  ✓

# Types of Fluids

## 1. Newtonian Fluids:

- Value of  $n = 1$  and  $C = 0$  in equation then the fluid is known as Newtonian fluid

## 2. Non-Newtonian Fluids:

- Value of  $n > 1$  or  $n < 1$  and  $C = 0$  in equation then the fluid is known as Non-Newtonian fluid

$y = m x + C = 0$

$n < 1$  -----

**Pseudo plastic:** most non-Newtonian fluids fall under this group. Viscosity decreases with increasing velocity gradient, e.g. colloidal substances like clay, milk, and cement.

# Types of Fluids

□  $n > 1$  -----

**Dilatants:** viscosity decreases with increasing velocity gradient, e.g. quicksand.

## 3. Idea Fluid

If  $\tau = 0$  in the equation then the fluid is known as Ideal Fluid.

## 4. Ideal Solid

If  $du/dy = 0$  in the equation then substance is known as Ideal Solid.

## 5. Ideal Plastic Fluid

If  $n = 1$  and  $C > 0$  then the fluid is known as Ideal Plastic fluid.
